In graph theory, a connected component (or just component) of an undirected graph is a subgraph in which any two vertices are connected to each other by paths, and which is connected to no additional vertices in the supergraph. For example, the graph shown in the illustration has three connected components. A vertex with no incident edges is itself a connected component.

Introduction. The advent of short-read sequencing machines gave rise to a new generation of assembly algorithms and software. This survey reviews algorithms for de novo whole-genome shotgun assembly from

next-generation sequencing data. It describes and compares algorithms that have been presented in the scientific literature and implemented in software.

A multiobjective optimization problem involves several conflicting objectives and has a set of Pareto optimal solutions. By evolving a population of solutions, multiobjective evolutionary algorithms (MOEAs) are able to approximate the Pareto optimal set in a single run.
