In theoretical computer science, the π -calculus (or pi-calculus) is a process calculus. The π -calculus allows channel names to be communicated along the channels themselves, and in this way it is able to describe concurrent computations whose network configuration may change during the computation.. The π -calculus is simple, it has very few terms and so is a very small language (see #Syntax ...

Fractional calculus is a branch of mathematical analysis that studies the several different possibilities of defining real number powers or complex number powers of the differentiation operator $D = (\)$, and of the integration operator $J = \hat{\alpha} \ll (\)$, and developing a calculus for such operators generalizing the classical one.. In this context, the term powers refers to iterative application of a ...

Deterministic modeling process is presented in the context of linear programs (LP). LP models are easy to solve computationally and have a wide range of applications in diverse fields. This site provides solution algorithms and the needed sensitivity analysis since the solution to a practical problem is not complete with the mere determination of the optimal solution.
